*Privately published under the auspices of the*

EXECUTIVE COMMITTEE OF THE

FRIENDS OF THE ARMY MEDICAL LIBRARY

Washington, D. C.

#### FOUR KEYS TO MEDICAL LITERATURE.

Today, we are in possession of four keys to the medical literature, which may be used with advantage in searching for information, precedents, strange or curious cases, and methods of experimentation. All of them were made in the Army Medical Library. The first of these keys made is the Index-Catalogue, the official publication of the Army Medical Library since 1879-1880. The next in chronological order was the now extinct Index Medicus, privately issued by staff members of the Army Medical Library between 1879 and 1926. The third is the Quarterly Cumulative Index issued since 1916 by the American Medical Association until 1927 when it became the direct continuation of the Index Medicus under the title Quarterly Cumulative Index Medicus. The fourth key is the Current List of Medical Literature published since the beginning of the current year by the Medico-film Service of the Army Medical Library. All of these publications contain references to medical journals, and are as complete as it is possible to make them, and their apparent differences concern the amount of material included in one issue, the frequency of publication, and the scheme of classification.

The Index-Catalogue of the Army Medical Library has a much wider basis to be built on and a much more permanent character than any of the three other bibliographical lists. It is designed for a systematic and exhaustive search of the literature by the scientists of all nations. Though seemingly an annual publication, the Index-Catalogue is never complete in one volume. It is complete only in a set or series of from 15 to 20 annual volumes, and such set covers the literature of so many years. Thus, in fact, the Index-Catalogue is issued every 15 or 20 years. The volume is but a sort of fasciculus of the series, and contains 20 years' literature on a fragment, one or two letters, of the full alphabet of medical subjects. Yet, in one complete set of the Index-Catalogue there are several hundred thousands of references included, not only to journal articles but also to books--all available for use in the library.

Since 1880, three complete sets or series, that is, three full alphabets of the Index-Catalogue have been published in 47 volumes. The fourth alphabet, or fourth series started in 1936, and proceeded to the letter "G" in 1941. All together there are more than 2,500,000 references contained in the 52 volumes published so far. The material is arranged under subjects in the form of a dictionary. A scientist wishing to collect literature on the subject of Brain has to search only 4 volumes of the set of the Index-Catalogue, and he will find approximately 90% of the literature of the world published on this subject up to 1937. Dealing with at least 15 years' material, the editor of the Index-Catalogue is in a position to make a systematic and very detailed classification of the subjects, and to break down the bulk of medical literature into small bricks by arranging the references under very specific headings. Even on small topics such as Arnica or the flagellate Astasia, 15 years' literature will grow to at least one short paragraph in the Index-Catalogue.

(Continued on inside back cover)

### 3. Bacteriology, Microbiology

Arch. Virusforsch., 1939-40, 1:

- SMORODINTSEFF, A.A., SHUBLADSE, A.K., & NEUSTROEV, V.D. Etiology of the autumn encephalitis in the Far East of the USSR. 549-59.

- HALL, E.K. Reversal of polarization in the ear primordium of Amblystoma punctatum, Linn. 141-51.

The old Index-Medicus was published monthly. The journal references were taken from the card file of the Index-Catalogue, and a monthly issue was complete in itself: it contained a full alphabet of subjects, and included the titles from journals received in the Army Medical Library during the previous 6-7 weeks. At the end of a year an Index to subjects and to authors was issued. The scheme of classification was borrowed from the Index-Catalogue, but, of course, such classification could not be made as detailed as that of the Index-Catalogue.

The Quarterly Cumulative Index Medicus, published as such since 1927, adopted the classification scheme of its predecessor, the old Index Medicus. It lists journal articles, with their titles translated into English, under the subject, and again, with their original titles, under authors. Originally, the Quarterly Cumulative Index Medicus received its material in part from the card file of the Index-Catalogue of the Army Medical Library; recently, it is based entirely on the material available at the headquarters of the American Medical Association. It is an excellent bibliographical tool for searching the medical literature not yet covered by the progressing fourth series of the Index-Catalogue. It is intended to keep the physicians of the U.S. abreast with the medical research of the world, with not more than a quarter year's delay. One issue is complete in itself, and it includes 3 months' material or, in the semi-annual cumulative issues, the literature of the 6 previous months. Those who wish to consult the literature of, say, ten years on a certain topic, must, therefore, handle 20 volumes at least, and, even so, they will still miss the literature of the very last 2-3 months.

The newborn baby of medical bibliography, the Current List of Medical Literature, is intended to satisfy the needs of the many medical scientists who are too impatient to wait 2-3 months until they can get the titles of the latest medical publications. There is scarcely more than 8 or 10 days' delay between making an index-card of a journal article for the card file of the Index-Catalogue in the library by the library staff and publishing it in the Current List of the Medicofilm Service operating in the library. In a week, about 1000 new titles important for medical progress will accumulate in the card boxes of subjects in the library. These 1000 titles may deal with as many subjects, and, therefore, it would be useless to attempt at listing them systematically under subjects. The nearest approach to an arrangement useful for everyone is the listing of titles in forms resembling to the tables of contents of the journals.

It may be asked how long the individual issues of the Current List will keep their usefulness. Since this publication is a new venture on an entirely new basis, the question has to be left open for a while. But, since the Current List is a sort of inventory catalogue for the new Medicofilm Service of the library, and since it includes the very material available in that library for microfilming, it is probable that, after the recent issues have lost their "news" value, they will be still useful even though the bibliographical references in them will have become parts of some future volumes of the Quarterly Cumulative Index Medicus or of the Index-Catalogue.

C.F.M.
